Let us recap what we did in PDS:

$$9 + 5 * 2 =$$

$$((9 + 5) * 2) = 28$$

$$(9 + (5 * 2)) = 19$$

$$9 - 5 + 2 =$$

$$((9 - 5) + 2) = 6$$

$$(9 - (5 + 2)) = 2$$

- a) Print operands as they arrive.
- b) If the stack is empty or contains a left parenthesis on top, push the incoming operator onto the stack.
- c) If the incoming symbol is a left parenthesis, push it on the stack.
- d) If the incoming symbol is a right parenthesis, pop the stack and print the operators until you see a left parenthesis. Discard the pair of parentheses.
- e) If the incoming symbol has higher precedence than the top of the stack, push it on the stack.
- f) If the incoming symbol has equal precedence with the top of the stack, use association. If the association is left to right, pop and print the top of the stack and then push the incoming operator. If the association is right to left, push the incoming operator.
- g) If the incoming symbol has lower precedence than the symbol on the top of the stack, pop the stack and print the top operator. Then test the incoming operator against the new top of stack.
- h) At the end of the expression, pop and print all operators on the stack. (No parentheses should remain.)

$G = \langle T, N, S, P \rangle$  is a (context-free) grammar where:

$T$	:	Set of terminal symbols
$N$	:	Set of non-terminal symbols
$S$	:	$S \in N$ is the start symbol
$P$	:	Set of production rules

Every production rule is of the form:  $A \rightarrow \alpha$ , where  $A \in N$  and  $\alpha \in (N \cup T)^*$ .

Symbol convention:

$a, b, c, \dots$	Lower case letters at the beginning of alphabet	$\in T$
$x, y, z, \dots$	Lower case letters at the end of alphabet	$\in T^+$
$A, B, C, \dots$	Upper case letters at the beginning of alphabet	$\in N$
$X, Y, Z, \dots$	Upper case letters at the end of alphabet	$\in (N \cup T)$
$\alpha, \beta, \gamma, \dots$	Greek letters	$\in (N \cup T)^*$

A grammar is left-recursive iff there exists a non-terminal  $A$  that can derive to a sentential form with itself as the leftmost symbol. Symbolically,

$$A \Rightarrow^+ A\alpha$$

*We cannot have a recursive descent or predictive parser (with left-recursion in the grammar) because we do not know how long should we recur without consuming an input*

# Curse or Boon 1: Left-Recursion

Note that,  $\begin{matrix} A & \rightarrow & A\alpha \\ A & \rightarrow & \beta \end{matrix}$  leads to:

$$\begin{aligned} A S &\Rightarrow A\alpha S \Rightarrow A\alpha\alpha S \Rightarrow A\alpha\alpha\alpha S \dots \\ &\Rightarrow A\alpha^* S \Rightarrow \beta\alpha^* S \end{aligned}$$

Removing left-recursion  $\begin{matrix} A & \rightarrow & \beta A' \\ A' & \rightarrow & \alpha A' \mid \epsilon \end{matrix}$  leads to:

$$\begin{aligned} A S &\Rightarrow \beta A' S \Rightarrow \beta\alpha A' S \Rightarrow \beta\alpha\alpha A' S \dots \\ &\Rightarrow \beta\alpha^* A' S \Rightarrow \beta\alpha^* S \end{aligned}$$

### Grammar $G_1$ before Left-Recursion Removal

1:  $E \rightarrow E + T$   
 2:  $E \rightarrow T$   
 3:  $T \rightarrow T * F$   
 4:  $T \rightarrow F$   
 5:  $F \rightarrow (E)$   
 6:  $F \rightarrow \text{id}$

### Grammar $G_2$ after Left-Recursion Removal

1:  $E \rightarrow T E'$   
 2:  $E' \rightarrow + T E' \mid \epsilon$   
 3:  $T \rightarrow F T'$   
 4:  $T' \rightarrow * F T' \mid \epsilon$   
 5:  $F \rightarrow (E)$   
 6:  $F \rightarrow \text{id}$

- These are syntactically equivalent. But what happens semantically?
- Can left recursion be effectively removed?
- What happens to Associativity?

- 1:  $E \rightarrow E + E$
- 2:  $E \rightarrow E * E$
- 3:  $E \rightarrow (E)$
- 4:  $E \rightarrow \text{id}$

- Ambiguity simplifies. But, ...
  - Associativity is lost
  - Precedence is lost
- Can *Operator Precedence* (*infix*  $\rightarrow$  *postfix*) give us a clue?

# Ambiguous Derivation of $\text{id} + \text{id} * \text{id}$

LR(0) Parser

SLR(1) Parser

LR(1) Parser

LALR(1) Parser

LR(k) Parser

- LR parser (Left-to-right, Rightmost derivation in reverse)
- Reads input text from left to right without backing up
- Produces a rightmost derivation in reverse
- Performs bottom-up parse
- To avoid backtracking or guessing, an LR(k) parser peeks ahead at k look-ahead symbols before deciding how to parse earlier symbols. Typically k is 1.
- LR parsers are deterministic – produces a single correct parse without guesswork or backtracking
- Works in linear time
- Variants of LR parsers and generators:
  - LP(0) Parsers
  - SLR Parsers
  - LALR Parsers – Generator: Yacc (AT & T), Byacc (Berkeley Yacc)
  - Canonical LR(1) or CLR Parsers – Generator: Bison (GNU)
  - Minimal LR(1) Parsers – Generator: Hyacc (Hawaii Yacc)
  - GLR Parsers – Generator: Bison (GNU) with %glr-parser declaration
- Minimal LR and GLR parsers have better memory performance CLR Parsers and address reduce/reduce conflicts more effectively

LR(0) Parser

SLR(1) Parser

LR(1) Parser

LALR(1) Parser

LR(k) Parser

- If  $S \Rightarrow_{rm}^+ \alpha$  then  $\alpha$  is called a **right sentential form**
- A **handle** of a right sentential form is:
  - A substring  $\beta$  that matches the RHS of a production  $A \rightarrow \beta$
  - The reduction of  $\beta$  to  $A$  is a step along the reverse of a rightmost derivation
- If  $S \Rightarrow_{rm}^+ \gamma A w \Rightarrow_{rm} \gamma \beta w$  where  $w$  is a sequence of tokens then
  - The substring  $\beta$  of  $\gamma \beta w$  and the production  $A \rightarrow \beta$  make the handle
- Consider the reduction of **id \* id + id** to the start symbol  $E$ :

	Sentential Form	Production
	<u>id</u> * id + id \$	$F \rightarrow \text{id}$
$\Rightarrow$	<u>F</u> * id + id \$	$T \rightarrow F$
$\Rightarrow$	<u>T</u> * <u>id</u> + id \$	$F \rightarrow \text{id}$
$\Rightarrow$	<u>T</u> * <u>F</u> + id \$	$T \rightarrow T * F$
$\Rightarrow$	<u>T</u> + id \$	$E \rightarrow T$
$\Rightarrow$	<u>E</u> + <u>id</u> \$	$F \rightarrow \text{id}$
$\Rightarrow$	<u>E</u> + <u>F</u> \$	$T \rightarrow F$
$\Rightarrow$	<u>E</u> + <u>T</u> \$	$E \rightarrow E + T$
$\Rightarrow$	<u>E</u> \$	

- LR Parsing is about *Handle Pruning* – Start with the sentence, identify handle, reduce – till the start-symbol is reached

LR(1) Parser

LALR(1) Parser

LR(k) Parser

- An LR parser is a DPDA having:
  - An Input Buffer
  - A Stack of Symbols – terminals as well as non-terminals
  - A DFA that has four types of actions:
    - ▷ **Shift** – Target state on input symbol
    - ▷ **Reduce** – Production rule and Target state on non-terminal on reduction (GOTO actions)
    - ▷ **Accept** – Successful termination of parsing
    - ▷ **Reject** – Failure termination of parsing
- The parser operates by:
  - Shifting tokens onto the stack
  - When a handle  $\beta$  is on top of stack, parser reduces  $\beta$  to LHS of production
  - Parsing continues until an error is detected or input is reduced to start symbol
- Designing an LR Parser is all about designing its DFA and actions

- $FIRST(\alpha)$ , where  $\alpha$  is any string of grammar symbols, is defined to be the set of terminals that begin strings derived from  $\alpha$ . If  $\alpha \Rightarrow^* \epsilon$ , then  $\epsilon$  is also in  $FIRST(\alpha)$ . *Examples:*
  - Given  $S \rightarrow 0|A, A \rightarrow AB|1, B \rightarrow 2$ ;  
 $FIRST(B) = \{2\}, FIRST(A) = \{1\}, FIRST(S) = \{0, 1\}$
  - Given  $E \rightarrow E + E|E * E|(E)|id$ ;  
 $FIRST(E) = \{id, ( \}$
  - Given  $B \rightarrow A, A \rightarrow Ac|Aad|bd|\epsilon$ ;  
 $FIRST(B) = FIRST(A) = \{\epsilon, a, b, c\}$
- $FOLLOW(A)$ , for non-terminal  $A$ , is defined to be the set of terminals  $a$  that can appear immediately to the right of  $A$  in some sentential form; that is, the set of terminals  $a$  such that there exists a derivation of the form  $S \Rightarrow^* \alpha A a \beta$ , for some  $\alpha$  and  $\beta$ .  $\$$  can also be in the  $FOLLOW(A)$ . *Examples:*
  - Given  $E \rightarrow E + E|E * E|(E)|id$ ;  
 $FOLLOW(E) = \{+, *, ), \$\}$
  - Given  $B \rightarrow A, A \rightarrow Ac|Aad|bd|\epsilon$ ;  
 $FOLLOW(B) = \{\$, \$\}, FOLLOW(A) = \{a, c, \$\}$

**LR(0) Parser**

SLR(1) Parser

LR(1) Parser

LALR(1) Parser

LR(k) Parser

- LR(0) grammars can be parsed looking only at the stack
- Making shift/reduce decisions without any look-ahead token
- Based on the idea of an item or a configuration
- An LR(0) item consists of a production and a dot ●

$$A \rightarrow X_1 \cdots X_i \bullet X_{i+1} \cdots X_n$$

- The dot symbol ● may appear anywhere on the right-hand side
  - Marks how much of a production has already been seen
  - $X_1 \cdots X_i$  appear on top of the stack
  - $X_{i+1} \cdots X_n$  are still expected to appear
- An LR(0) state is a set of LR(0) items
  - It is the set of all items that apply at a given point in parse

The diagram illustrates the LR(0) items and transitions for the grammar. It consists of 9 states, each containing LR(0) items. The transitions are as follows:

- State 1 (Start State):  $S' \rightarrow S \$$ ,  $S \rightarrow \cdot x$ ,  $S \rightarrow \cdot (L)$ . Transitions:  $x \rightarrow$  State 2,  $( \rightarrow$  State 3,  $\$ \rightarrow$  State 4.
- State 2:  $S \rightarrow x \cdot$ . Transition:  $x \rightarrow$  State 8.
- State 3:  $S \rightarrow ( \cdot L, S$ ,  $L \rightarrow \cdot S$ ,  $L \rightarrow \cdot L, S$ ,  $L \rightarrow \cdot x$ ,  $S \rightarrow \cdot (L)$ . Transitions:  $( \rightarrow$  State 3 (self-loop),  $S \rightarrow$  State 6,  $x \rightarrow$  State 2,  $L \rightarrow$  State 5.
- State 4:  $S' \rightarrow S \cdot \$$ .
- State 5:  $S \rightarrow ( L \cdot, S$ . Transitions:  $, \rightarrow$  State 8,  $) \rightarrow$  State 7.
- State 6:  $L \rightarrow S \cdot$ .
- State 7:  $S \rightarrow ( L \cdot )$ .
- State 8:  $L \rightarrow L \cdot, S$ ,  $S \rightarrow \cdot x$ ,  $S \rightarrow \cdot (L)$ . Transitions:  $x \rightarrow$  State 2,  $( \rightarrow$  State 3,  $, \rightarrow$  State 8.
- State 9:  $L \rightarrow L \cdot S$ . Transition:  $S \rightarrow$  State 9.

LR Fundamentals

LR(0) Parser

SLR(1) Parser

LR(1) Parser

LALR(1) Parser

LR(k) Parser

Grammar  $G_9$

1:	$S$	$\rightarrow$	$L = R$
2:	$S$	$\rightarrow$	$R$
3:	$L$	$\rightarrow$	$*R$
4:	$L$	$\rightarrow$	$id$
5:	$R$	$\rightarrow$	$L$

$I_0: S' \rightarrow \cdot S$   
 $S \rightarrow \cdot L = R$   
 $S \rightarrow \cdot R$   
 $L \rightarrow \cdot * R$   
 $L \rightarrow \cdot id$   
 $R \rightarrow \cdot L$

$I_1: S' \rightarrow S \cdot$

$I_2: S \rightarrow L \cdot = R$   
 $R \rightarrow L \cdot$

$I_3: S \rightarrow R \cdot$

$I_4: L \rightarrow * \cdot R$   
 $R \rightarrow \cdot L$   
 $L \rightarrow \cdot * R$   
 $L \rightarrow \cdot id$

$I_5: L \rightarrow id \cdot$

$I_6: S \rightarrow L = \cdot R$   
 $R \rightarrow \cdot L$   
 $L \rightarrow \cdot * R$   
 $L \rightarrow \cdot id$

$I_7: L \rightarrow * R \cdot$

$I_8: R \rightarrow L \cdot$

$I_9: S \rightarrow L = R \cdot$

- $= \in FOLLOW(R)$  as  $S \Rightarrow L = R \Rightarrow *R = R$
- So in State#2 we have a shift/reduce Conflict on  $=$
- The grammar is not ambiguous. Yet we have the shift/reduce conflict as SLR is not powerful enough to remember enough left context to decide what action the parser should take on input  $=$ , having seen a string reducible to  $L$ .
- To resolve, we build LR(1) Parser

LR Fundamentals

LR(0) Parser

SLR(1) Parser

LR(1) Parser

LALR(1) Parser

LR(k) Parser

**Sample Grammar  $G_7$**

1:  $S \rightarrow CC$   
2:  $C \rightarrow cC$   
3:  $C \rightarrow d$

**Augmented Grammar  $G_7$**

0:  $S' \rightarrow S$   
1:  $S \rightarrow CC$   
2:  $C \rightarrow cC$   
3:  $C \rightarrow d$

- **LR(1) Item:** An LR(1) item has the form  $[A \rightarrow \alpha.\beta, a]$  where  $A \rightarrow \alpha\beta$  is a production and  $a$  is the look-ahead symbol which is a terminal or \$. As the dot moves through the right-hand side of the production, token  $a$  remains attached to it. LR(1) item  $[A \rightarrow \alpha., a]$  calls for a reduce action when the look-ahead is  $a$ . *Examples:*  $[S \rightarrow .CC, \$]$ ,  $[S \rightarrow C.C, \$]$ ,  $[S \rightarrow CC., \$]$

- **Closure(S):**

For each item  $[A \rightarrow \alpha.B\beta, t] \in S$ ,  
For each production  $B \rightarrow \gamma \in G$ ,  
For each token  $b \in FIRST(\beta t)$ ,  
Add  $[B \rightarrow .\gamma, b]$  to  $S$

Closure is computed transitively. *Examples:*

- $Closure([S \rightarrow C.C, \$]) = \{[S \rightarrow C.C, \$], [C \rightarrow .cC, \$], [C \rightarrow .d, \$]\}$
- $Closure([C \rightarrow c.C, c/d]) = \{[C \rightarrow c.C, c/d], [C \rightarrow .cC, c/d], [C \rightarrow .d, c/d]\}$

- **State:** Collection of LR(1) items and their closures. *Examples:*

- $\{[S \rightarrow C.C, \$], [C \rightarrow .cC, \$], [C \rightarrow .d, \$]\}$
- $\{[C \rightarrow c.C, c/d], [C \rightarrow .cC, c/d], [C \rightarrow .d, c/d]\}$

LR(1) Parser

**LALR(1) Parser**

LR(k) Parser

**Sample Grammar  $G_7$**

1:  $S \rightarrow CC$   
2:  $C \rightarrow cC$   
3:  $C \rightarrow d$

**Augmented Grammar  $G_7$**

0:  $S' \rightarrow S$   
1:  $S \rightarrow CC$   
2:  $C \rightarrow cC$   
3:  $C \rightarrow d$

- **LR(1) States:** Construct the Canonical LR(1) parse table.
- **LALR(1) States:** Two or more LR(1) states having the same set of core LR(0) items may be merged into one by combining the look-ahead symbols for every item. Transitions to and from these merged states may also be merged accordingly. All other states and transitions are retained. *Examples:*
  - Merge  
State#3 =  $\{[C \rightarrow c.C, c/d], [C \rightarrow .cC, c/d], [C \rightarrow .d, c/d]\}$  with  
State#6 =  $\{[C \rightarrow c.C, \$], [C \rightarrow .cC, \$], [C \rightarrow .d, \$]\}$  to get  
State#36 =  $\{[C \rightarrow c.C, c/d/\$], [C \rightarrow .cC, c/d/\$], [C \rightarrow .d, c/d/\$]\}$
  - Merge  
State#4 =  $\{[C \rightarrow d., c/d]\}$  with  
State#7 =  $\{[C \rightarrow d., \$]\}$  to get  
State#47 =  $\{[C \rightarrow d., c/d/\$]\}$
- **Reduce/Reduce Conflict:** LR(1) to LALR(1) transformation cannot introduce any new shift/reduce conflict. But it may introduce reduce/reduce conflict.

Construct an LALR(1) parser for  $G_7$ :

1:	$S$	$\rightarrow$	$CC$
2:	$C$	$\rightarrow$	$cC$
3:	$C$	$\rightarrow$	$d$

LR(k) Parser

Grammar  $G_{11}$

- 1:  $A \rightarrow B c d$
- 2:  $A \rightarrow E c f$
- 3:  $B \rightarrow x y$
- 4:  $E \rightarrow x y$

- For this grammar, an example input that starts with  $xy c$  is enough to confuse an LR(1) parser, as it has to decide whether  $xy$  matches  $B$  or  $E$  after only seeing 1 symbol further (i.e.  $c$ ).

**LR(1) Parser:**  
 $A' \rightarrow A$   
 $A \rightarrow B c d \mid E c f$   
 $B \rightarrow x y$   
 $E \rightarrow x y$

- An LL(1) parser would also be confused, but at the  $x$  - should it expand  $A$  to  $B c d$  or to  $E c f$ , as both can start with  $x$ . An LL(2) or LL(3) parser would have similar problems at the  $y$  or  $c$  respectively.
- An LR(2) parser would be able to also see the  $d$  or  $f$  that followed the  $c$  and so make the correct choice between  $B$  and  $E$ .
- An LL(4) parser would also be able to look far enough ahead to see the  $d$  or  $f$  that followed the  $c$  and so make the correct choice between expanding  $A$  to  $B c d$  or to  $E c f$ .

### Grammar $G_{12}$

- 1:  $A \rightarrow B C d$
- 2:  $A \rightarrow E C f$
- 3:  $B \rightarrow x y$
- 4:  $E \rightarrow x y$
- 5:  $C \rightarrow C c$
- 6:  $C \rightarrow c$

- The grammar would confuse any LR(k) or LL(k) parser with a fixed amount of look-ahead
- To workaround, rewrite

- 1:  $A \rightarrow B C d$
- 2:  $A \rightarrow E C f$
- 3:  $B \rightarrow x y$
- 4:  $E \rightarrow x y$

as

- 1:  $A \rightarrow BorE c d$
- 2:  $A \rightarrow BorE c f$
- 3:  $BorE \rightarrow x y$

#### LR(1) Parser:

$A' \rightarrow A$

$A \rightarrow BorE c d \mid BorE c f$

$BorE \rightarrow x y$
