Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Which values in a program reside in registers? ([Register Allocation](#))
- In which register? ([Register Assignment](#))
 - The two together are usually loosely referred to as **Register Allocation (RA)**
- What is the unit at the level of which register allocation is done?
 - Typical units are *basic blocks*, *functions*, and *regions*
 - RA within *basic blocks* is called **local RA**
 - RA within *functions* and *regions* are known as **global RA**
 - Global RA requires lot more time than local RA

Some Issues in Register Allocation

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Phase ordering between *register allocation* and *instruction scheduling*
- In which register? (*register assignment*)
 - Performing RA first restricts movement of code during scheduling – *not recommended*
 - Scheduling instructions first cannot handle spill code introduced during RA
 - ▷ Requires another pass of scheduling
- Tradeoff between *speed* and *quality of allocation*
 - In some cases, for example, in Just-In-Time compilation, cannot afford to spend too much time in register allocation
 - Only local or both local and global allocation?

The Problem

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Global Register Allocation assumes that allocation is done beyond basic blocks and **usually at function level**
- Decision problem related to register allocation
 - Given an intermediate language program represented as a control flow graph and a number k , is there an assignment of registers to program variables such that
 - ▷ *no conflicting variables* are assigned the same register,
 - ▷ *no extra loads or stores* are introduced, and
 - ▷ *at most k* registers are used
- This problem has been shown to be NP-hard (Sethi 1970)
- **Graph colouring** is the most popular heuristic used
- However, there are simpler algorithms as well

Conflicting Variables

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Two variables interfere or conflict if their **live ranges** intersect
 - A variable is **live** at a point p in the flow graph, if there is a **use** of that variable in the path from p to the end of the flow graph
 - The **live range** of a variable is the *smallest set of program points* at which it is live
 - The representation for a point is:
 - ▷ basic block number
 - ▷ instruction number in the basic block

Example

- **Live range of A: B2, B4, B5**
- **Live range of B: B3, B4, B6**

Global Register Allocation via Usage Counts (for Single Loops)

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Allocate registers for variables used within loops
- Requires information about liveness of variables at the entry and exit of each basic block (BB) of a loop
- Once a variable is computed into a register, it stays in that register until the end of the BB (subject to existence of next-uses)
- Load/Store instructions cost 2 units (because they occupy two words)

Global Register Allocation via Usage Counts (for Single Loops)

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

[1] For every **usage** of a variable **v** in a BB, **until it is first defined**, do:

- $\text{savings}(v) = \text{savings}(v) + 1$
- after **v** is defined, it stays in the register any way, and all further references are to that register

[2] For every variable **v computed** in a BB, if it is **live on exit** from the BB,

- count a **savings of 2**, since it is not necessary to store it at the end of the BB

Global Register Allocation via Usage Counts (for Single Loops)

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Total savings per variable v are

$$\sum_{B \in \text{Loop}} (\text{savings}(v, B)) + 2 * \text{liveandcomputed}(v, B))$$

- $\text{liveandcomputed}(v, B)$ in the second term is 1 or 0
- On entry to (exit from) the loop, we load (store) a variable live on entry (exit), and lose 2 units for each
 - But, these are *one time* costs and are neglected
- Variables, whose savings are the highest will reside in registers

Global Register Allocation via Usage Counts (for Single Loops)

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

Savings for the variables

	B1	B2	B3	B4	
a:	(0+2)+	(1+0)+	(1+0)+	(0+0)=	4
b:	(3+0)+	(0+0)+	(0+0)+	(0+2)=	5
c:	(1+0)+	(1+0)+	(0+0)+	(1+0)=	3
d:	(0+2)+	(1+0)+	(0+0)+	(1+0)=	4
e:	(0+2)+	(0+0)+	(1+0)+	(0+0)=	3
f:	(1+0)+	(1+0)+	(0+2)+	(0+0)=	4

If there are 3 registers, they will be allocated to the variables, a, b, and d (or f)

Global Register Allocation via Usage Counts (for Nested Loops)

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- We first assign registers for inner loops and then consider outer loops. Let **L1** nest **L2**
- For variables assigned registers in L2, but not in L1
 - load these variables on entry to L2 and store them on exit from L2
- For variables assigned registers in L1, but not in L2
 - store these variables on entry to L2 and load them on exit from L2
- All costs are calculated keeping the above rules

Global Register Allocation via Usage Counts (for Nested Loops)

Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- **Case 1:** Variables x, y, z assigned registers in L2, but not in L1
 - Load x, y, z on entry to L2
 - Store x, y, z on exit from L2
- **Case 2:** Variables a, b, c assigned registers in L1, but not in L2
 - Store a, b, c on entry to L2
 - Load a, b, c on exit from L2
- **Case 3:** Variables p, q assigned registers in both L1 and L2
 - No special action

Chaitin's Formulation of the Register Allocation Problem

Module 10

Das & Mitra

Objectives &
Outline

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- A graph colouring formulation on the interference graph
- Nodes in the graph represent either live ranges of variables or entities called webs
- An edge connects two live ranges that interfere or conflict with one another
- Usually both adjacency matrix and adjacency lists are used to represent the graph.
- Assign colours to the nodes such that two nodes connected by an edge are not assigned the same colour
 - The number of colours available is the number of registers available on the machine
 - A k-colouring of the interference graph is mapped onto an allocation with k registers

Issues in Register
Allocation

The Problem

GRA by Usage
Count

Chaitin's
Algorithm: GRA
by Graph
Coloring

Graph Coloring

Framework

Example

Register Spill

- Choose an arbitrary node of degree less than k and put it on the stack
- Remove that vertex and all its edges from the graph
 - This may decrease the degree of some other nodes and cause some more nodes to have degree less than k
- At some point, if all vertices have degree greater than or equal to k , some node has to be spilled
- If no vertex needs to be spilled, successively pop vertices off stack and colour them in a colour not used by neighbours (reuse colours as far as possible)

Coloring

Graph Coloring

Framework

Example

Register Spill

- Additional spills might be required before a coloring is found
- The tricky part is deciding what to spill
- Possible heuristics:
 - Spill temporaries with most conflicts
 - Spill temporaries with few definitions and uses
 - Avoid spilling in inner loops
- Any heuristic is correct
